

QR-DRUM

IMPROVE THE LOGISTICAL, ECONOMIC
AND ENVIRONMENTAL PERFORMANCE
OF YOUR CABLE DEPLOYMENTS

Would you like to optimise your cable deployment?

Have you identified operational and logistical problems during your cable deployments?

- Complex stock management with **limited access to data on the remaining cable lengths available on cable drums**
- Sub-optimal cable management, leading to a **high scrap rate** of 10% on average, and as much as 20% for certain projects!
- An **inordinate amount of time** spent by project managers and warehouse clerks on logistics monitoring with technicians and sub-contractors
- **Tedious and incomplete field reports**

ACOME has developed the innovative digital solution **QR-DRUM**, allowing you to access cable drum deployment history, track their geographical location and identify remaining cable lengths.

QR-DRUM : a cable drum's digital twin

Our receptive solution uses a QR code connected to a mobile application and an intuitive online portal, all supported by a cloud infrastructure for data storage and processing.

A unique platform to access key information, thus reducing the overall cost of cable management through **optimised logistics**, and **enhancing operational efficiency**.

Reducing cable waste and scrap also helps to **reduce the environmental impact of deployments**.

QR-Drum is compatible with all your cable-drum stock, no matter the manufacturer!

QR codes are installed by default in the factory on all ACOME cable drums during manufacture, so there is no need to intervene in the field.

QR-Drum is not exclusive to ACOME products. It is also easy to use on manufacturers' cable drums. You simply need to retrieve data on the cable drums in your stock to identify them within the tool and then pair them with the QR codes via the online portal.

Benefits of QR-Drum

With an easy-to-use interface on smartphones and computers, QR-Drum allows you to identify the current geographical location of a cable drum, its full deployment history and the remaining cable length available.

Location of cable drums

Identify the exact location of the cable drum.

Optimise transport during a cable drum's life cycle.

Access to data on cable stocks

Manage your stocks in real time for all your deployments and storage facilities.

Identify remaining cable lengths on cable drums.

Greater monitoring of the supply chain

Transfer the responsibility for a cable drum to a colleague or sub-contractor.

Track the history of stock movements and facilitate mutual assistance for deployment during the full cable drum's life cycle.

Supports proactive stock planning

Avoid dead stocks and stock-outs.

Manage your supply needs easily.

Performance indicators

Track sub-contractors' activity in real-time.

Assess partners' quality of service using objective data.

Reduced environmental impact

Reduce cablesrap rates.

A risk-free return on investment!

A profitable solution from the first few metres of cable:

- > Cut fibre cable wastage by 50%
- > Save 5% or more on cable costs

Benefit from QR-Drum's added value:

- Simpler and smarter cable stock management
- Geolocation status of each cable drum and its stock
- Quick and easy to access deployment history by scanning the QR code
- Saves time for operational project management
